

Nest Challenge

Birds live in nests up in the trees in the forest. As you walk through the forest you will see them high up in the trees. Birds make their nests from things that they find in the forest like leaves, twigs and moss. The birds use sticks and twigs to make the shape of their nest and moss to make it comfy and warm; they also use mud to hold all of the materials together like glue for their nest. Can you build a nest that a bird could live in? It needs to be strong enough for a bird to live in and lay their eggs in in the spring time and comfy enough to keep them warm in the winter.

Here are some pictures of birds nests for you to look at:

Once you have made a nest for your bird you may want to think about what type of bird will be living in their nest, what you would like to call it and the food that it might eat.

Remember that you cannot take your nests with you so be sure to take some photos to show everyone the different nests that you all made.
